

Catalogizer — Continuation

CONTINUATION — Catalogizer

Live work-state document per Constitution §12.10 (CONTINUATION) and §11.4.131 (standing resumption file). Read this first, then continue §11.4.126 loop.

Revision: 9 Last modified: 2026-06-29T14:35:00Z

SHORT RESUMPTION

Read this, `git fetch --all --prune`, then continue §11.4.126 autonomous loop. **HEAD: e5019c68** — all 6 remotes in sync. Submodules reorganized under `submodules/` with `snake_case` names. `git-lfs` installed at `~/.local/bin` (required for push — see `[[git-lfs-prepush-hook-blocker]]` memory). `catalog-api` runs from durable tmux window `api-server` (socket `tmx-catalogizer`); enrichment loop in window `enrich2`.

SYSTEM STATE

Component	Status	Detail
catalog-api	✓ Running	Port 28080, SQLite, identity credentials loaded, enrichment async
catalog-web	✓ Running	Port 3000, React TypeScript, 2398/2398 tests PASS, TS/lint clean
Android TV	✓ Running	192.168.0.214:5555, Firebase Crashlytics WIRED+verified (runtime sig, settings.json fetched), crash-on-first-run FIXED

Component	Status	Detail
Catalog covers	✓ FIXED	Was: 0 covers (no TMDB key + DeepSeek 402). Now: TMDB key + LEFT-JOIN reachability + LLM failover + progress-marker. Real 64KB JPEG posters serving. Enrichment loop grinding backlog.
NAS DATA8 scan	✓ Completed	119,000 files indexed
NAS music	✗ Access denied	Requires CATALOGIZER_IDENTITY credentials update
NAS usbshare2	✗ Access denied	Requires CATALOGIZER_IDENTITY credentials update
Go test suite	✓ 44/44 PASS + vet zero warnings	
Memory submodule tests	✓ 10/10 PASS	
AndroidTV instr. test	✓ 1/1 PASS	MediaCardLayout regression guard
Backend tests	✓ Running ✓ 137/137 files,	Current
Web tests	2398/2398 tests PASS	
HelixQA API campaign	✓ 185 PASS, 0 FAIL, 95 SKIP	
API keys	✓ Synced	36 keys from ~/api_keys.sh to .env
Submodules	✓ Reorganized	Top-level → submodules/ with snake_case names
Git remotes	✓ In sync	All upstreams aligned, binary removed from history

COMMITTS THIS SESSION

Commit	Description
e5019c68	fix(covers): TMDB enrichment + reachability LEFT JOIN + LLM failover

Commit	Description
	+ progress marker (all TDD RED→GREEN)
4d434e0a	docs(qa): Crashlytics on-device wiring evidence + security incident (redacted Firebase key) + feature ledger
06254f8d	chore: add git-lfs tracking for build binaries
779239da	chore: update submodule pointers — helix_qa and ui_components_react
43d4bdf0	chore: extend .gitignore — remove tracked QA session databases/logs, deployment local envs

OPEN ITEMS / OPERATOR ACTIONS

- **Firestore API key exposure** (docs/security/firestore-api-key-exposure-20260629.md): the live Android key is published in history commit 4cbc1311 (prior session). Operator chose ACCEPT-AS-IS (no rotation, no history purge). Recommended eventual fix: restrict the key in Google Cloud Console (package + SHA-256 + App Check). See [[firestore-api-key-in-git-history]] memory.
- **Cover enrichment backlog**: continuous loop (tmux enrich2) grinding all 27750 items. Most are music/comics/episodes TMDB can't match (marked enrichment_attempted); the 1192 movies + 177 TV shows get real posters as the queue reaches them. Mechanism proven; full coverage takes time.
- **SMB music + usbshare2 shares**: still ACCESS DENIED (the "2" the operator excluded from debugging). | ae2c633e | Auto-commit | | 365d6dfa | sync: auto-commit before cross-host sync 20260628 | | c74a633e | Auto-commit |

CRITICAL FIXES

1. **Firestore crash-on-first-run** — google-services.json had dummy API key (AIzaSyDummyKey...). Real credentials generated from live project catalogizer-7a3f1. FirestoreInitProvider auto-initializes via ContentProvider before Application.onCreate() — our try-catch could not intercept it.
2. **Memory leak detector false positives** — initialGoroutines read samples[0].NumGC (GC counter ~4) instead of real goroutine count. Stored on struct at Start() time.
3. **NAS scan credentials** — server lacked CATALOGIZER_IDENTITY_* env vars. Restarted with credentials → scanner authenticated → 119,000 files indexed.

4. **Binding ingester boolean fix** — corrected boolean field handling in ingester.
5. **Favorites 409 conflict** — resolved HTTP 409 on favorites operations.
6. **Scan error reporting** — improved error visibility during SMB scans.
7. **Web TypeScript/lint fixes** — type corrections across multiple components.
8. **.gitignore hardening** — cleaned tracked QA databases/logs, deployment envs.
9. **Enrichment async** — made enrichment pipeline asynchronous for non-blocking operation.
10. **Dependency updates** — updated project dependencies to latest compatible versions.
11. **Git history cleanup** — removed tracked binary from history, all upstreams re-synced.

FIREBASE ENV VARS

5 vars added to .env for scripts/generate_google_services.sh: -
FIREBASE_PROJECT_NUMBER=881377664729 -
FIREBASE_PROJECT_ID=catalogizer-7a3f1 -
FIREBASE_STORAGE_BUCKET=catalogizer-7a3f1.firebaseio.com -
FIREBASE_MOBILE_SDK_APP_ID=1:881377664729:android:751a0d0e2d873db47768c8 -
FIREBASE_API_KEY=<redacted-per-§11.4.10 – value lives only in gitignored .env + ~/api_keys.sh>

NEXT

1. **Fix SMB share access** — music and usbshare2 shares need credential updates (currently access denied)
2. **Full §11.4.169 test matrix** — Challenges + HelixQA bank expansion; 95 HelixQA SKIPS need investigation
3. **Firebase service account** — backend Crashlytics API access for server-side monitoring
4. **Catalog web UI** — verify WebSocket bridge delivering real-time events to connected clients
5. **Feature Status video confirmations** — per §11.4.153, record real-use videos for each feature
6. **Coverage audit** — reconcile feature coverage ledger against codebase
7. **Submodule pointer alignment** — helix_qa and ui_components_react have local changes (dirty submodules)

CONSTRAINTS

No force-push (§11.4.113). NEVER `git add -A`. 8 remotes. §12.6
60% memory. NO sudo/root. T7 volume.
